- Use "CB" Suffix in model number
- Protects from rotating shaft exposure and Foreign material penetration

Integral Self-Alignment

Our bearings represent the continuation of 80 years of bearing technology and experience. This design allows the inner race to misalign freely in any direction up to 4° of total misalignment.

By design, these bearings accept both radial and thrust loads under static, oscillatory, or dynamic conditions. The load is taken on the roller raceways, not the roller ends. This means that when thrust is loaded up to their allowable limit, **the bearings do not exhibit roller end wear.**

Featuring SHURLOK Adapter Mounts – Taking the Mystery Out of Mounting

Auxiliary end caps and four field interchangeable seal options ensure long bearing life through a full range of applications.

Self-aligning spherical roller bearing provides a total of 4° static and dynamic misalignment.

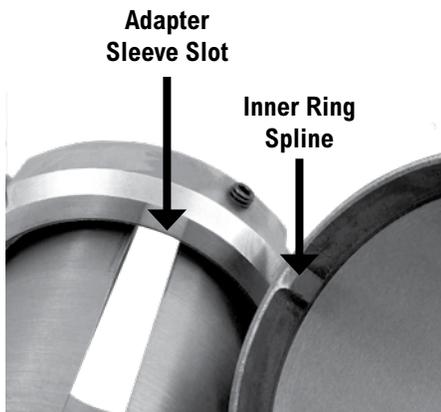

Super-finished raceways provide a cool running, quiet, high-speed and high-load capacity bearing

Roller elements are precision ground and super-finished to provide longer bearing life

Adapter sleeve assembly allows easy installation/removal, plus enables use of commercial grade shafts

Positive Locking System allows minimal vibration during operation, therefore not requiring scheduled inspections for snugness of mountings

Rating Code

- 4 - Excellent - Best seal for conditions listed.
- 3 - Good - Sealability is above average.
- 2 - Fair - Seal performs under intermittent conditions.
- 1 - Limited - Actual conditions must be known to evaluate sealability. Contact Rexnord for special assistance in the realm of materials and designs.
- 0 - Not acceptable - Will not effectively perform seal functions. Contact Rexnord for special assistance in the realm of materials and designs.

Seal Selection Guide

The choice of the seal for a mounted bearing is often the key to successful bearing operation and long service life. The SEAL SELECTION GUIDE incorporates years of Rexnord’s experience against the wide variety of conditions encountered on actual applications. Following the simple selection procedure outlined can translate the benefits of that broad experience to the individual applications through the choice of the most effective seal.

How to Use the Selection Guide

- The appropriate seal for a given application may be selected by comparing the job application conditions against those listed in the Seal Rating Guide on this page.
- When more than one application condition is present, the most appropriate seal may be selected based on prime sealing for the most detrimental condition, and secondary consideration given to the other application conditions.
- Addition of auxiliary caps will enhance the primary seal performance shown in the chart.

Considerations in Addition to Seal Selection

Under certain adverse conditions, other changes should be considered to achieve maximum bearing life:

- A. High temperature lubricants where housing or ambient temperatures exceed +200°F,
- B. Special greases for additional bearing protection where excessive water, solvents or chemicals are present.
- C. EP (extreme pressure) greases where high load, high shock load, or continuous vibration is present.
- D. Readjustment of internal operating clearance of bearing where extreme high or low temperature conditions exist.

Refer to Seal Rating Guide shown above for speeds in excess of those listed in this table.

*Actual bearing speed limits are largely based upon the applied load and can be found on the Load Rating Table.

Selection Guide

To select a bearing, determine the applied radial load, the applied thrust load, the desired Rating Life, and applicable operating conditions. The procedure shown here will aid in selecting a bearing to meet an L_{10} design life. The formulas for calculating life expectancy should be used to determine the Rating Life L_{10} for the bearing selected.

The selection procedures and rating formulas shown here are in agreement with The American Bearing Manufacturers Association Standards and ANSI/ABMA STD 9-1990. Ratings are based on fatigue life. The Rating Life L_{10} or fatigue life at 90% reliability is the usual basis for bearing selection.

To assure a satisfactory bearing application, fitting practice, mounting, lubrication, sealing, static rating, housing strength, operating conditions and maintenance must be considered.

Steps for Selection

Step 1

Determine an appropriate L_{10} design life.

Type of service	Operating time, hours per year	Design life, years	L_{10} design life, hours
Light seasonal usage	500 to 750	3-5	3,000
Heavy seasonal usage	1,400 to 1,600	4-6	8,000
Industrial—8 hour shift	2,000	10	20,000
Industrial—16 hour shift	4,000	10	40,000
Industrial—continuous	8,700	10	80,000 to 100,000

Step 2

Determine a required $\left(\frac{C}{P}\right)$ from Table 1.

Step 3

Calculate the required C and select a roller bearing.

a For radial load only:

$$P = F_r$$

$$\text{required } C = \left(\frac{C}{P}\right) P \text{ using } \left(\frac{C}{P}\right) \text{ from Step 2}$$

Select a roller bearing from Table 2 with a basic load rating C equal to or greater than the required C.

Step 3 (continued)

b For combined radial and thrust loads:

Select a trial roller bearing of the desired shaft size from Table 2.

Calculate the ratio of thrust load F_a to the radial load F_r .

$$\frac{F_a}{F_r}$$

Calculate the equivalent radial load P

$$P = X F_r + Y F_a$$

If $\frac{F_a}{F_r}$ is equal to or less than e, then $P = X1 F_r + Y1 F_a$

If $\frac{F_a}{F_r}$ is greater than e, then $P = X2 F_r + Y2 F_a$

For values of e, X1, Y1, X2, and Y2, see Table 2.

Calculate the required C

$$\text{required } C = \left(\frac{C}{P}\right) P \text{ using } \left(\frac{C}{P}\right) \text{ from Step 2.}$$

Consult Table 2, basic load rating. If a smaller bearing meets, or nearly meets, the required C, its life expectancy can be calculated.

Note: If the load P is greater than .25C, consult Rexnord Bearing Division.

Basic Formula

$$\left(\frac{C}{P}\right) = \left(\frac{L_{10} \times n \times 60}{1,000,000}\right)^{3/10}$$

$$L_{10} = \frac{\left(\frac{C}{P}\right)^{10/3} \times 1,000,000}{n \times 60}$$

Life Expectancy

To calculate the Rating Life L10 of any selected or trial bearing:

Step 1

Determine the equivalent radial load P.

a For radial load only:

$$P = Fr$$

b For combined radial and thrust load:

$$P = XFr + YFa$$

if $\frac{Fa}{Fr}$ is equal to or less than e, then

$$P = X1Fr + Y1Fa$$

if $\frac{Fa}{Fr}$ is greater than e, then

$$P = X2Fr + Y2Fa$$

For values of e, X1, Y1, X2, and Y2, consult the appropriate bearing rating Table 2.

Step 2

Calculate the ratio of the basic load rating C to the equivalent radial load.

$$\left(\frac{C}{P}\right)$$

Step 3

Approximate the bearing life from Table 1.

Life Adjustment

The Rating Life, L10, may be modified for some applications in accordance with the formula

$$Ln = a1a2a3L10$$

where Ln = Adjusted life for (100-n) % reliability,

a1 = Life adjustment factor for reliability

a2 = Life adjustment factor for material and processing

a3 = Life adjustment factor for operating conditions.

For most normal applications, all factors will be taken as 1, and the Rating Life used as the selection basis or life estimate. In addition, as long as standard catalog bearings are used, a2 will be normally set equal to one.

The factor a3 covers such things as lubrication, misalignment, and temperature. Some conditions that could yield a3 significantly different than unity include speeds less than 20000 DN or greater than 200000 DN, temperatures below -40°F (-40°C) or above 275°F (135°C). For other possible conditions, as well as additional information on life adjustment factors, consult Rexnord Bearing Division.

*Values in table represent the 9000 and 6000 series bearings. When commercial grade shafting and clearance mounting are used, the table values should be reduced up to 5% for the 5000 series, 10% reduction for 3000 and reduced up to 15% for the 2000 series.

SHURLOK Installation Tools

Rex is pleased to offer a quick installation tool for the SHURLOK bearing. This tool is designed as a supplement to the spanner wrench or drift pin method. The installation tool can be attached to a 3/4" or 1/2" drive ratchet, torque wrench, or breaker bar which can be used as a lever arm. Simply fit the installation tool over the locknut by placing the tool's teeth into the locknut slots. The tool's unique shape allows it to be used from the side or the top of the bearing. To order, refer to the table below for the installation tool that fits your shaft size.

Link-Belt Spherical Roller Bearings

Self-aligning double row spherical roller bearings are designed to distribute the load over the symmetrical rollers, assuring positive tracking and smooth operation. The large roller complement provides high capacity for radial or combined radial-thrust loads. Osculation clearance at the ends of the rollers compensates for shock loads and prevents destructive edge loading. These precision bearings with double contoured retainer pockets are designed to meet a broad range of application requirements.

1. Mounting feature

- B22400 Series – Spring locking collar locks inner ring securely to shaft.
- B22500 Series – Two spring locking collars lock inner ring securely to shaft.
- B22600 Series – Tapered adapter mounting system.

2. Choice of three seals

- Floating Labyrinth Type H
- Spring-Loaded Lip Type E
- Triple Lip Type E7

3. Long inner ring for high stability and load support

4. Self-aligning double row

Spherical roller bearing allows for +/- 2 degrees of misalignment to accommodate variations between shaft and support structure as well as shaft deflection during operation.

5. Double contoured retainer pockets

Assures accurate roller control.

6. One-piece cast iron or cast steel housing.

7. Slotted bolt holes in pillow block

Bases facilitate mounting; bottom of base is machined.

Spring Locking Collar(s) – B22400 & B22500 Series

The spring locking collar(s) design provides a secure grip of the wide inner ring bearing to the shaft. The setscrews extend through the inner ring of the bearing and lock firmly onto the shaft. Installation is fast and simple. Correctly tightening the setscrews produces elastic strain in the spring locking collar resulting in a continuous pressure on the setscrew threads and providing a positive lock.

Series B22400, B22500 & B22600 Spherical Roller Bearing Units and Take-ups – Features and Benefits

Series B22400 are single collar mounted spherical roller bearing units. Series B22500 are double collar mounted spherical roller bearing units. Series B22600 are adapter mounted spherical roller bearing units. These units provide economic and versatile arrangements for supporting shafts carrying substantial radial or combination radial and thrust loads. These units are especially adaptable for conveyors, elevators, general industrial machinery, heavier duty fans and blowers, power transmission applications, ditchers, trenchers, pavers and other such applications. These series of bearings are easy to mount, sealed, pre-lubricated and do not require bearing adjustment during mounting.

Adapter Mount – B22600 Series

The adapter mounting provides better concentricity and shaft control, increasing service life. Where Turned, Ground and Polished shafting is the norm on collar-mounted units, the maximized mounting power of the B22600 allows for Commercial Grade Shafting compatibility (a commonly used grade of shafting due to its price and availability). Shaft damage from set screws is eliminated with the B22600's improved mounting design. Shaft damage from the bearing inner ring fretting to the shaft (the result of a clearance or loose fit) is also eliminated. These improvements facilitate easier bearing removal, replacement bearing installation and longer shaft service life.

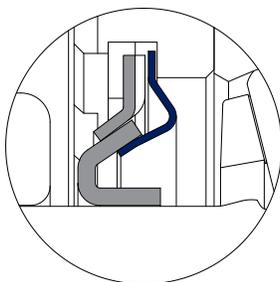

Interchangeable Seals

Three standard sealing systems are available; each offering maximum protection for various application conditions. These seals are interchangeable and are designed for grease lubrication.

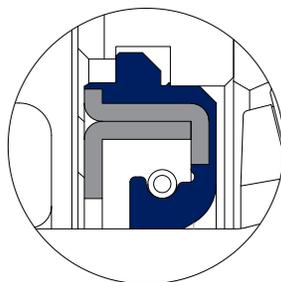

Type H Seal

Type H floating labyrinth seals have multiple self-centering rings held securely in a steel carrier. Type H seals are normally furnished.

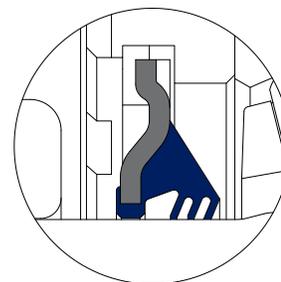

Type E Seal

Type E spring loaded lip seals utilize a spring to provide uniform pressure for keeping the sealing lip in contact with the inner ring. Type E seals are normally used for liquid splash environments.

Type E7 Seal

Type E7 triple lip seal with metal outboard guard is designed for the most severe of applications. The outboard metal guard protects the inner seal lips from abrasion and damage. The three molded, heavy contact lips provide excellent protection from abrasive media, dust and moisture.

One-Piece Cast Iron or Cast Steel Housings

Compact one-piece housings provide for strength and load support. Scientifically contoured housing design provides superior rigidity. Cast iron or cast steel pillow blocks have two or four slotted bolt holes with ample space provided for drilling dowel pin holes. Flanged and flanged cartridge units have drilled mounting

holes and machined mounting surfaces for maximum stability. Cartridge units have cast iron or steel housings and are finished to precision tolerances. Take-up units have machined slots for smooth, precise operation. Pillow blocks, flanged, and cartridge units are available for fixed or expansion operation.

Seal Selection Guide

The choice of the seal for a mounted bearing is often the key to successful bearing operation and long service life. The SEAL SELECTION GUIDE incorporates years of Rexnord's experience against the wide variety of conditions encountered on actual applications. Following the simple selection procedure outlined can translate the benefits of that broad experience to the individual applications through the choice of the most effective seal.

How to Use the Selection Guide

1. The appropriate seal for a given application may be selected by comparing the job application conditions against those listed in the SEAL RATING GUIDE on this page.
2. When more than one application condition is present, the most appropriate seal may be selected based on prime sealing for the most detrimental condition, and secondary consideration given to the other application conditions.

Considerations in Addition to Seal Selection

Under certain adverse conditions, other changes should be considered to achieve maximum bearing life:

- A. High temperature lubricants where housing or ambient temperatures exceed +200°F,
- B. Special greases for additional bearing protection where excessive water, solvents or chemicals are present.
- C. EP (extreme pressure) greases where high load, high shock load, or continuous vibration is present.
- D. Readjustment of internal operating clearance of bearing where extreme high or low temperature conditions exist.

Series B22400, B22500 & B22600 Spherical Roller Bearing Selection Guide

To select a bearing, determine the applied radial load, the applied thrust load, the desired Rating Life, and applicable operating conditions. The procedure shown here will aid in selecting a bearing to meet an L₁₀ design life. The formulas for calculating life expectancy should be used to determine the Rating Life L₁₀ for the bearing selected.

The selection procedures and rating formulas shown here are in agreement with the American Bearing Manufacturers Association (ABMA) standards

and ANSI/ABMA Standards STD 11-1990. Ratings are based on fatigue life. The Rating Life L₁₀ or fatigue life at 90% reliability is the usual basis for bearing selection. For radial load applications only, Table 4, can be used to select a bearing or to determine L₁₀ life expectancy.

To assure a satisfactory bearing application, fitting practice, mounting, lubrication, sealing, static rating, housing strength, operating conditions and maintenance must be considered.

Steps for Selection

Step 1

Determine an appropriate L₁₀ design life.

Type of service	Operating time, hours per year	Design life, years	L ₁₀ design life, hours
Light seasonal usage	500 to 750	3-5	3,000
Heavy seasonal usage	1,400 to 1,600	4-6	8,000
Industrial—8 hour shift	2,000	10	20,000
Industrial—16 hour shift	4,000	10	40,000
Industrial—continuous	8,700	10	80,000 to 100,000

Step 2

Determine a required $\left(\frac{C}{P}\right)$ from Table 1.

Step 3

Calculate the required C and select a roller bearing.

a For radial load only:

$$P = F_r$$

$$\text{required } C = \left(\frac{C}{P}\right) P \text{ using } \left(\frac{C}{P}\right) \text{ from Step 2}$$

Select a roller bearing from Table 2 with a basic load rating C equal to or greater than the required C.

Step 3 (continued)

b For combined radial and thrust loads:

Select a trial roller bearing of the desired shaft size from Table 2.

Calculate the ratio of thrust load F_a to the radial load F_r .

$$\frac{F_a}{F_r}$$

Calculate the equivalent radial load P

$$P = X F_r + Y F_a$$

If $\frac{F_a}{F_r}$ is equal to or less than e, then $P = X_1 F_r + Y_1 F_a$

If $\frac{F_a}{F_r}$ is greater than e, then $P = X_2 F_r + Y_2 F_a$

For values of e, X₁, Y₁, X₂, and Y₂, see Table 2.

Calculate the required C

$$\text{required } C = \left(\frac{C}{P}\right) P \text{ using } \left(\frac{C}{P}\right) \text{ from Step 2.}$$

Consult Table 2, basic load rating. If a smaller bearing meets, or nearly meets, the required C, its life expectancy can be calculated.

Note: If the load P is greater than .25C, consult Rexnord Bearing Division.

Selection

Symbols for formulas:

C = basic load rating, pounds (or newtons)	n = speed, revolutions per minute

Basic Formula

$$\left(\frac{C}{P}\right) = \left(\frac{L_{10} \times n \times 60}{1,000,000}\right)^{3/10}$$

$$L_{10} = \frac{\left(\frac{C}{P}\right)^{10/3} \times 1,000,000}{n \times 60}$$

Life Expectancy

To calculate the Rating Life L₁₀ of any selected or trial bearing:

Step 1

Determine the equivalent radial load P.

a For radial load only:

$$P = F_r$$

b For combined radial and thrust load:

$$P = X F_r + Y F_a$$

if $\frac{F_a}{F_r}$ is equal to or less than e, then

$$P = X_1 F_r + Y_1 F_a$$

if $\frac{F_a}{F_r}$ is greater than e, then

$$P = X_2 F_r + Y_2 F_a$$

For values of e, X₁, Y₁, X₂, and Y₂, consult the appropriate bearing rating Table 2.

Step 2

Calculate the ratio of the basic load rating C to the equivalent radial load.

$$\left(\frac{C}{P}\right)$$

Step 3

Approximate the bearing life from Table 1.

Life Adjustment

The Rating Life, L₁₀, may be modified for some applications in accordance with the formula

$$L_n = a_1 a_2 a_3 L_{10}$$

where L_n = Adjusted life for (100-n) % reliability,

a₁ = Life adjustment factor for reliability

a₂ = Life adjustment factor

for material and processing

a₃ = Life adjustment factor for operating conditions.

For most normal applications, all factors will be taken as 1, and the Rating Life used as the selection basis or life estimate. In addition, as long as standard catalog bearings are used, a₂ will be normally set equal to one.

The factor a₃ covers such things as lubrication, misalignment, and temperature. Some conditions that could yield a₃ significantly different than unity include speeds less than 20000 DN or greater than 200000 DN, temperatures below -40°F (-40°C) or above 275°F (135°C). For other possible conditions, as well as additional information on life adjustment factors, consult Rexnord Bearing Division.

If the load P is greater than .25C, consult Rexnord Bearing Division.

For B22400 Series, reduce C Basic Load rating by 15%.

For B22500 Series, reduce C Basic Load rating by 5%.

For vertical shift application, consult Rexnord Bearing Division.
